

Flight Opportunities Program  
Office of the Chief Technologist

## Descent and Landing Flight Campaign - March 2013

## Campaign

**Flight Campaign Dates:** March 18-28, 2013  
**Location:** Mojave Air and Spaceport, Mojave CA  
**Flight Profiles:** Simulated Martian and Lunar landing trajectories

## Technology Payload

### Guidance Embedded Navigator Integration Environment (GENIE) Charles Stark Draper Laboratory

GENIE is an autonomous flight control system designed to demonstrate planetary precision landing AGN&C and to facilitate the integration / demonstration of other landing technologies needed for exploration of planets, moons, and asteroids. GENIE provides a research flight control interface to test such follow on technologies as terrain relative navigation, autonomous hazard detection and autonomous flight management under real flight conditions.

## Flight Platform

### XA-0.1B "Xombie" Masten Space Systems

Xombie is a fully reusable vertical takeoff and vertical landing (VTVL) launch vehicle used for low speed and low altitude testing. The vehicle is equipped with a hypervisor that enables third party GN&C/avionics packages to control Xombie in flight while maintaining Masten's GN&C as a supervisor and always-on safety net. The vehicle placed in the NASA funded Northrop Grumman Lunar Lander Challenge X Prize and has recently served as a landing systems test platform for Draper Laboratory and the NASA Jet Propulsion Laboratory (JPL).

# Precision Landing Exploration Technology (PLANET) Demonstration

## Problem Statement

- PLANET will mature Autonomous Guidance, Navigation, and Control (AGNC) technology required for precision lunar and planetary landing.
- sRLV flights allow the AGNC to fly lunar/planetary-like landing trajectories exercising the system in the most relevant terrestrial environment.
- Extends sRLV capabilities and enables broad range of future technology demonstrations for systems such as those needed for Autonomous Landing and Hazard Avoidance

## Technology Development Team

- PI: Douglas Zimpfer, Draper Laboratory, [dzimpfer@draper.com](mailto:dzimpfer@draper.com)
- Funding: NASA FOP
- Technology Partner: NASA ALHAT Team

## Proposed Flight Experiment

### Experiment Readiness:

- The experiment is currently ready to fly

### Test Vehicles:

- sRLV

### Test Environment:

- An sRLV that can be controlled by the payload to fly the desired lunar or planetary precision landing trajectories in order to properly exercise the sensors and algorithms.

### Test Apparatus Description:

- The key enabler for PLANET is the Guidance Embedded Navigator Integration Environment (GENIE) pictured below. GENIE is a stand-alone avionics package that controls the sRLV and houses the sensors and algorithms required to enable precision landing.

## Technology Maturation

- The technology is currently TRL5. GENIE will be TRL6 after flying precision planetary/ lunar landing trajectories at proper speeds and altitudes
- Maturation Steps
  1. Adapt and integrate GENIE AGNC system to sRLV Flight Vehicle
  2. Perform series of flights demonstrating precision landing capability

## Objective of Proposed Experiment

- 1-Mature AGNC, 2-Extend capability of sRLV for EDL trajectories, 3-Enable future technology demonstrations
- Data obtained will be used to determine robustness of GENIE and the AGNC system. These results will then be used to determine future design enhancements.

**Technology Areas Addressed:** TA4 Robotics, Tele-Robotics and Autonomous Systems; TA7 Human Exploration Destination Systems  
TA9 Entry, Descent, and Landing Systems; TA11 Modeling, Simulation, Information Technology and Processing
